```
Q1: Which of the following states are entangled?
                                                                              |\Psi(0)\rangle := \cos(\theta)(\infty) + \sin(\theta)(1)
                                                                                                                                                                                                                  050574
   Sol
      For \theta = 0, |4(0)\rangle = |00\rangle = |0\rangle \otimes |0\rangle so not entangled.
       Otherwise, let IV)= 210>+BID and 10>= 810>+811>.
                Then IV) 81W) = 28100) + 28101) + 88111).
       Thus we need 0.05 = \cos(\theta)

0.05 = \cos(\theta)

0.05 = \cos(\theta)

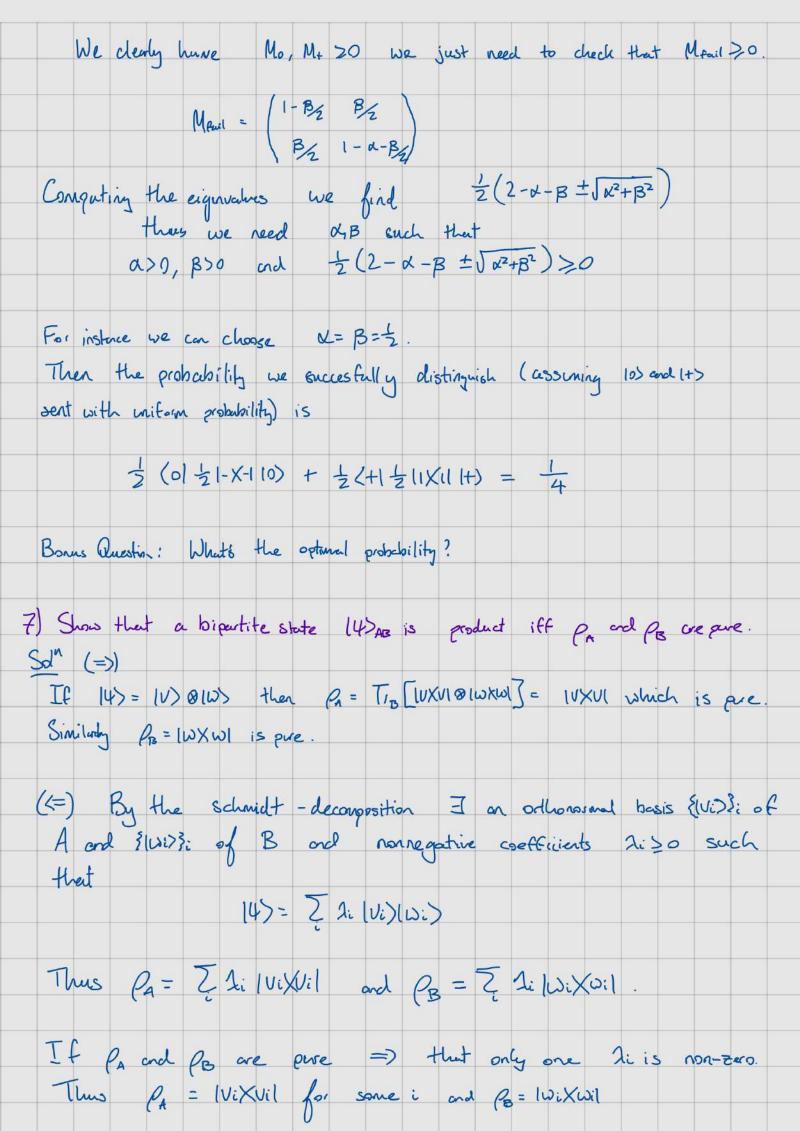

0.05 = \cos(\theta)
                                                                                                         B8 = sin (θ)
          if the state is not entargled. But \alpha S=0 => \alpha =0 or \delta =0. If \alpha =0 we need \cos(\theta)=0 and if \delta =0 we need \sin(\theta)=0. But this is
         not possible for O<05 the. Thus (4(0)) is entargled for all
          DE (0, 194)
     Q2 Let {14i} be a set of states and Pi be a probability
                            distribution. Prave that for P= I Pil4: X4:1 we have
     a) Tr(\rho)=1
b) \rho>0.
Also show \rho is \rho we iff Tr(\rho^2)=1.
                                             linearity (Compute in ONB containing 142).
     (a) Tr(p) = \sum_{i} p_{i} Tr[|\psi_{i} \times \psi_{i}|] = \sum_{i} p_{i} = 1
Probability distribution
           (b) We need \rho is Hermitian and \langle x | \rho | x \rangle \geq 0 \forall |x\rangle \in \mathcal{H}.
Hermitian is clear \rho^+ = \overline{L} \rho_i (14iX4i)^+ = \overline{L} \rho_i 14iX4i = \rho.
                                            (x(p(x) = \frac{1}{2} \rho_i \( \pi \) \( \pi
```

For parity recall P is pure when p= 14X41 for some State 14). Then $\rho^2 = 14X41$ thus $Tr(\rho^2) = 1$ when ρ is pure. Now suppose $\rho = \frac{1}{2} \rho_i \left[\frac{1}{i} \left(\frac{1}{i} \left(\frac{\rho^2}{i} \right) \right] = 1$. By the spectral theorem we can assume that [14:33: form on orthonormal basis. Then P= 2; Pi Pi |4i X4: 14; X4:1 = \(\bar{\chi} \chi^2 \left[\Psi \times \Psi \right]. So $T_i(\rho^2) = \overline{\zeta} \rho_i^2$ But we know $\overline{\zeta} \rho_i = 1$ and so $\overline{\zeta} \rho_i^2 = 1$ only when $\rho_i = 1$ for some i and $\rho_i = 0$ $\forall j \neq i$. In that case $\rho = |\Psi_i \times \Psi_i|$ and is sure. Q3 a) Prove that any qubit state p can be written as $\rho = \frac{1 + n \times X + n \times Y + n \times Z}{2}$ with n_{∞} , n_{y} , $n_{z} \in \mathbb{R}$ and $n_{\infty}^{2} + n_{y}^{2} + n_{z}^{2} \leq 1$. Can show that $\{21, X, Y, 2\}$ form an orthogonal basis with respect to the inner-product (R,S) = Tr[R+S] for the Hilbert space of 2x2 matrices with elements in C. Thus we can always write P= = (no 1+ nxX+ nyY+nzZ) for some no, nx, ny, nz EC. Now we need Tr[Q] = 1, as Tr(XJ = Tr(Y) = Tr(Z) = 0=) that no=1. Secondly we need () to be Hermitian (as it is positive semidefinite), P=Pt. This implies (noting X, Y, Z are all Hermitian) $\overline{n_x}X + \overline{n_y}Y + \overline{n_z}Z = n_xX + n_yY + n_zZ$ where a denote the complex conjugate of a. As 1, X, Y, Z ore on orthogonal basis this implies that ni=ni => n∞,ny,nz EIR

Thus we arrive at $\rho = \frac{1}{2} \begin{pmatrix} 1 + \Omega_2 & \Omega_{\infty} - i n_y \\ \Omega_{\infty} + i n_y & 1 - \Omega_2 \end{pmatrix}$ Finally for P20 we require the eigenvalues of p to be non-negative. We find the eigenvalues of the above matrix to be b) Show p is pure iff n2 + n2 + n2 = 1. Solⁿ Note that ρ is que iff $T_1(\rho^2) = 1$. We have $T_1(\rho^2) = \frac{1}{2}(1 + n_x^2 + n_y^2 + n_z^2)$ Thus $T_1(\rho^2) = 1 \iff n_x^2 + n_y^2 + n_z^2 = 1$ 图 Q4) Prove that for the state (4) = \$\frac{1}{2}(101) - (10)\$ we have for any single qubit unitary U, 14) = (UOU) (4). Proof Write the Unitary as $U = |\omega \times v| + |\omega^{\perp} \times v^{\perp}|$ for two orthonormal bases $\{v\}$, v^{\perp} and $\{v\}$. You can verify (letting $v = v_0 \cdot v + v_0 \cdot v + v_0 \cdot v = v_0 \cdot v + v_0 \cdot v + v_0 \cdot v = v_0 \cdot v + v_0 \cdot v + v_0 \cdot v = v_0 \cdot v + v_0 \cdot v + v_0 \cdot v = v_0 \cdot v + v_0 \cdot v + v_0 \cdot v = v_0 \cdot v + v_0 \cdot v + v_0 \cdot v + v_0 \cdot v = v_0 \cdot v + v$ ((VIOCVI) 14) = 0 (<v+10<v+)(4) = 0 ((\(\bullet \varphi\) = \(\frac{1}{\sqrt{2}}\) (\(\sqrt{\sqrt{000}}\) \(\sqrt{\sqrt{11}}\) - \(\sqrt{\sqrt{001}}\) \(\sqrt{\sqrt{100}}\) =: \(\kappa\) ((V) = - K Thus (404) 14) = (((() @(m) - (m) @ (w)) N for normalization we must have $K=J_{\overline{2}}$. So (MON) 14) = /2 (M) O (M) - (M) O (M) Now write (w>= woo 10) + wor (1) and (w+) = wro 10) + w. 11).

```
Then (UOU) 14) = 1/2 (WOOWII - WOIWIO) (101> - 110>).
 Again by normalization (which is preserved by unitaries) we must have
    Jz (U00W11-W01W10) = Jz => (U0U) (4> = 14>
(25a) Prove the truce is cyclic, ie. Tr(XY) = Tr(YX).
  Write X = I x = lixil and Y = I yes lixil.
          XY = I xis you lixu
           YX = Z yis xin li Xul
   Thus TICXY) = \( \int \alpha_{ij} \times_{ij} \tag{y}_{ii} = \int \frac{1}{ij} \text{ y}_{ij} \times_{ji} = \text{Ti}(\frac{1}{2}\text{X}).
  b) Use this to prove trace is Boxis independent i.e.,

Tr(X) = Z < v: | X | v: > for any orthonormal basis { | v: > }:
  Let U= [ IViXiI, then U is unitary and we have
   Tr[X] = Tr(uu+X) = Tr(u+Xu) = Z <i1 u+Xu1i>
                                       = Z (il ZIXVI) X(ZIVAXNI) II)
                                       = Z (ili Xvil X lvi Xili)
                                       = Z (v: 1 X lv:> B
6) Define a Boutcome POUM & Mo, M+, Meail & that allows
   you to distinguish 10) from 1+) sometimes but never misidentifies, i.e.,
                     (01 Molo) > 0, (+1 M+1+) >0
                   (0) M+10) = 0 (+1 M0(+) = 0
    We need (01 M+ (0) =0 so we take M+ = & 11 X11. for
    some & So. Similarly we set Mo = BI-X-1-
    Then take Manil = 11- Mo-M+.
```

=> (4) = Ni) Ø(Wi) is a godnet state.
8) (Deriving the Tsilelson bound) Alice and Bob play the CHSH game. For convenience we let the inputs or, ye \$0,13 and the outputs a, b \(\xi \xi + 1, -13 \). The winning condition then becomes
(-1) = ab Let Alice's projective measurement on input or be {A11>c, A-11z} and Bob's projective measurement on input y be {B11y, B-11y}.
Let the quantum state shared between Alice and Bob be 14) Define observables $A_x = A_{11x} - A_{-11x}$ By = Bily - B-11y
a) Show that for any fixed oxy the expected value of ab is given by (41 Ax @ By 14)
Sol^ (41 Az @ By14) = (41 (A11x-A-11x) @ (B11y-B-11y) 14)
= (4 A11x 8 B11y 14) - (4 A11x 8 B11y 14) - (4 A1x 8 B11y 14) + (4 A-11x 8 B-11y 14) = P(a=1,b=1 x,y) - P(a=1,b=-1 x,y)
$- p(a=-1,b=1 x,y) + p(a=-1,b=-1 x,y)$ $= \sum_{ab} ab p(ab xy)$ $= \mathbb{E}[ab X=x,Y=y]$
b) Let $K = A_0 \otimes B_0 + A_0 \otimes B_1 + A_1 \otimes B_0 - A_1 \otimes B_1$. Show that Alice and Bob's winning probability is $\frac{1}{2} + \frac{1}{8} < 41 \times 14 > .$

```
Sol" (41 Az 0 By 14) = p(1112y) + p(-1-112y) - p(1,-112y) - p(-1,112y)
   A p(1,-1/24) = 1 - p(11/24) - p(-1-1/24) - p(-1,11xy) we get
        241Ax@Byl4)= 2(p(111xy)+p(-1-11xy)) -1
 Performing the same argument with p(1112cy) we also arrive at
        <41 Az 8By14> = 1 - 2(p(1,-1/2y) + p(-1,1/2y))
  Thus <41 K14) = 2(p(11100) + p(-1-1100) + p(11101) + p(-1-1101)
                       + p(11111) + p(1,-1111) + p(-1,1111) )
        = 2 (4. IP(Alice and Bob win)) - 4
  => IP(Alice and Bob win) = = = + = (4/14/4)
c) Show W^2 = 41 - [A_0, A_1] \otimes [B_0, B_1] where [X, Y] = XY - YX
 Som
       First note that A_{\infty} = A_{11\infty} - A_{-11\infty} = 2A_{11\infty} - 1
           Az = 4 Anz - 4 Anx + 1 = 11.
        Similarly By = 1
        Now K = Ao ⊗ (Bo+Bi) + Ai ⊗ (Bo-Bi)
        So W= A0 8 (B0+B1)2 + A0 A1 8 (B0+B1) (B0-B1)
                + A, A, D (Bo-B) (Bo+B) + A,2 & (Bo-B)2
       = 10 (21 + BoBi+BiBo) + Ao Ai (1 - BoBi+BiBo-1)
       + AIA. 8(11-BIB. + BOB. - 11) + 11(21-BOB. - BIB.)
```
